2.3 Differences Between Kernels & API Calls

A CUDA kernel is an extended C function that, when called, are executed multiple times in parallel by different CUDA threads on the GPU. The CUDA APIs are programming interfaces that allow the programmer to use the CUDA device, i.e. the GPU. Kernel functions are written by the programmer and are meant to execute specific (mostly computation-intensive) tasks on the GPU, while API calls are provided by the CUDA library and are to manage the CUDA runtime environment and mostly prepare for the execution of kernels. While kernels are always executed by CUDA cores, CUDA APIs do not necessarily involve the execution of CUDA cores.

2.4 MXNet CPU Execution

```
Loading fashion-mnist data... done
Loading model... done
New Inference
EvalMetric: {'accuracy': 0.8236}
```

Run Time. 5.06s

2.5 MXNet GPU Execution

```
Loading fashion-mnist data... done
Loading model... done
New Inference
EvalMetric: {'accuracy': 0.8236}
```

Run Time: 4.40s
